

Muhammad Musayyab

DevOps Engineer

Cell: +92 336 5988565 | Email: itsmusayyab@gmail.com | Address: Islamabad, Pakistan

About Me

I'm a DevOps Engineer who genuinely enjoys the problem-solving that comes with the role. My foundation is Linux administration, but over the past couple of years I've built solid experience with AWS, GCP, Azure, Docker, Terraform, and GitHub Actions, working on real projects across CI/CD, infrastructure provisioning, and cloud migrations. I'm detail-oriented and methodical, and I care about doing things the right way rather than just the fast way. I work well with developers and like being the person who makes deployments less stressful for everyone involved.

Education

- **BS Software Engineering** – Virtual University (2025)

Experience

Remote DevOps Engineer – Forge-Tech, Croatia

March 2025 – Continued

- Maintained and improved GitHub Actions CI/CD pipelines, making deployments more consistent and reducing manual steps.
- Automated repetitive deployment and maintenance tasks using Bash/Python scripts, saving time and reducing human error.
- Provisioned and managed cloud infrastructure across AWS and Azure, supporting reliable application environments.
- Deployed and monitored Docker-based applications, helping improve reliability and day-to-day operations.
- Managed SSH access, IAM roles, security patches, and OS updates using least-privilege principles to keep systems secure and maintainable.
- Collaborated with developers to troubleshoot deployment issues and improve delivery speed without naming or exposing client environments.

DevOps Engineer Intern – Antematter

November 2025 – March 2026

- Delivered DevOps work across AWS and GCP for live client/internal projects, improving how services were deployed, automated, and maintained.
- Helped migrate the University of Chicago Health stack from an EC2-based Docker setup to GCP Cloud Run and Cloud SQL, reducing manual ops and making deployments easier to manage and troubleshoot.
- Resolved rollout issues across service accounts, secrets, Cloud SQL connectivity, VPC access, environment variables, and Cloud Run revisions, helping stabilize the production setup.
- Helped build an end-to-end automated deployment flow for CageCalls using ECR, App Runner, RDS, Secrets Manager, S3, and GitHub Actions, reducing manual deployment effort and supporting a highly available environment.
- Used AWS CDK as infrastructure as code to define and update CageCalls cloud resources in a repeatable, version-controlled way, making infrastructure changes easier to manage and safer to deploy.
- Built and documented daily cloud cost reporting with AWS Lambda, EventBridge, SNS, and Cost Explorer, while investigating and removing unnecessary resources to improve cost visibility and reduce waste.
- Automated Route 53 DNS and subdomain provisioning with Bash, cutting repeated manual setup for new client environments.
- Applied hands-on work in Terraform, Docker, Kubernetes, Cloudflare, monitoring, and serverless tooling through project delivery and internal upskilling.

Cloudera Administration Internship – Blutech Consulting

October 2025 – November 2025

- Onboarded to Cloudera (Manager, HDFS, YARN); set up dev access and ran basic cluster health checks.
- Practiced ingest → lake flow: loaded sample data to HDFS, converted to Parquet, ran Spark SQL queries.
- Studying & documenting data-warehousing concepts (OLTP vs OLAP, star/snowflake, partitioning, file formats) and mapping them to Hive/Impala.
- Basic Linux administration.

Data Engineering Internship – Blutech Consulting

May 2025 – July 2025

- Wrote and tuned SQL queries for analytics and ad-hoc asks.
- Designed and modified tables, keys, and indexes to boost performance.
- Performed data-cleansing and bulk updates with INSERT/UPDATE/MERGE.
- Explored core data-warehouse concepts (star schema, OLTP vs OLAP).

Technical Skills

- **Cloud Platforms:** AWS (EC2, ECR, ECS, Lambda, RDS, S3, Route 53, CloudWatch, EventBridge, SNS, App Runner, Secrets Manager) GCP (Cloud Run, Cloud SQL, Artifact Registry, Secret Manager, VPC) · Azure
- **Infrastructure as Code & Automation:** Terraform · AWS CDK · Bash scripting
- **Containers & CI/CD:** Docker · Docker Compose · GitHub Actions
- **Linux & Version Control:** Linux administration · Git
- **Databases & Data:** PostgreSQL · SQL (schema design, joins, aggregations, INSERT/UPDATE/MERGE)
- **Networking & DNS:** CCNA fundamentals · Load balancers · DNS · Cloudflare
- **Monitoring & Observability:** CloudWatch · Prometheus/Grafana · Loki
- **Orchestration & Serverless:** Kubernetes basics · AWS Lambda · Cloud Run · App Runner

Projects

DevOps Pipeline Simulation – Final Year Project (Virtual University 2024)

- Developed a functional DevOps pipeline simulation showcasing the CI/CD workflow using GitHub Actions, Docker, and AWS.
- Containerized a static web app using Docker, integrating automated testing and building processes into the CI pipeline.
- Automated infrastructure provisioning with Terraform to deploy resources in AWS.
- Leveraged AWS services including ECS (for deployment), ECR (for container registry), and CloudWatch (for monitoring, logging, and alerting).
- Configured GitHub Actions to trigger on git push, automating tasks such as running JavaScript tests, building containers, and deploying updates.
- Integrated monitoring, logging, and alerting systems to improve visibility and resilience of the pipeline.
- Followed best practices for security, scalability, and maintainability throughout the project lifecycle.
